

IP Interface N148/22
5WG1 148-1AB22
Product and Applications Description

The IP Interface N148/22 is a DIN rail mounted device.

This device utilizes the KNXnet/IP standard and enables communication connections to KNX/EIB lines or systems via data networks using the Internet Protocol (IP). PC's or other data processing equipment can exchange data with KNX/EIB devices through this communication link.

The physical connection to the KNX/EIB bus is established via a bus connector terminal block. For connection to the data network (IP via 10BaseT) the device contains an RJ45 socket.

By using a LAN modem a KNX/EIB installation can be remotely accessed even if there is no direct data network connection between a PC and an IP Interface. LAN modems are available on the market for standard telephone, ISDN or DSL connections.

The IP Interface requires additional operating power for its operation. The IP Interface N148/22 can source this operating power via the network connection from "Power over Ethernet" according to IEEE 802.3af. Alternatively, the operating power can be provided via a second terminal block (white-yellow terminals) by a safety extra low voltage (SELV) power supply AC/DC 24 V or by a bus power supply (unchoked power, DC 29V). When a SELV power supply is connected the operating power is sourced from it.

The IP Interface has these characteristics:

- Simple connection to hierarchically superimposed systems via Internet Protocol (IP)

- Direct access to the KNX/EIB installation from any access point to the IP network (KNXnet/IP Tunneling)
- Communication between buildings and facilities
- LED display of
 - operation
 - KNX/EIB communication
 - IP communication
- Simple configuration with standard ETS
- Easy connection to SCADA and Facility Management systems (see: Supported Software)

KNXnet/IP Tunneling interface to the bus

A direct connection between a networked PC and the bus can be established via a data network and the IP Interface N 148/22. This allows for accessing the bus from any access point in the data network.

The IP Interface N148/22 provides up to five KNXnet/IP Tunneling connections, allowing for e.g. simultaneous configuration with ETS3 and operation of a visualization.

Note

For stable communication via KNXnet/IP Tunneling the IP Interface must use a separate individual address for each KNXnet/IP Tunneling connection. These additional individual addresses must be different from the individual address of the device and must not be used by any other bus device. In ETS these individual addresses should be reserved by proxy devices.

ObjectServer interface to the bus

A direct connection between a networked PC and the bus can also be established via a data network and the IP Interface N148/22 using ObjectServer. ObjectServer compared with KNXnet/IP Tunneling provides the advantage that the communication can be maintained even over network connections with a transmission time for the datagrams of over one second (e.g. satellite connections).

Assignment of additional individual addresses

Additional individual addresses are either assigned with ETS or alternatively without a tool automatically by the device itself.

The automatic address assignment for KNXnet/IP Tunneling and ObjectServer is started when the learning button is pressed during normal operation for more than 5 seconds but less than 10 seconds. The programming LED flashes during the address assignment process. The device checks which individual addresses are already used by other bus devices connected to the bus line. These addresses are not used for the address assignment.

IP Interface N148/22**5WG1 148-1AB22**

By adding additional bus devices at a later time one or more of the additional individual addresses could be assigned twice. When during normal operation the learning button is pressed for more than 10 seconds all additional individual addresses in the IP Interface N148/22 are reset to the default value (15.15.255) and the programming LED is turned off.

IP address assignment

Please consult your network administrator regarding configuration of the parameters device IP address, subnet mask, and DHCP.

The IP address of the IP Interface N148/22 is assigned manually using ETS, automatically by a DHCP server in the IP network, or by the device itself (AutoIP). Assignment of the IP address by a DHCP server allows for changes of the device IP address without using ETS. Configuration of the DHCP server may require the MAC address, which is printed on the device. If a DHCP server is not available the device assigns itself an IP address (AutoIP).

Default factory settings

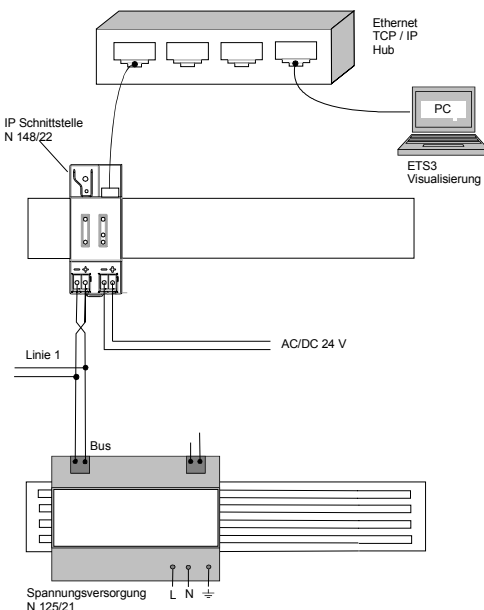

The IP Interface ships with these default factory settings:

- Physical address of the IP Interface:
15.15.15 (= FFFF hex)
- IP address assignment via DHCP

Application programs

The IP Interface N148/22 can be configured with ETS2 v1.2 or higher.

It requires the application program "**12 CO IP Interface 720001**".

Example of Operation**Example of Operation 1 with external auxiliary power supply****Example of Operation 2 with auxiliary power supply from unchoked bus power supply**

IP Interface N148/22

5WG1 148-1AB22

Installation Instructions

- The device may be used for permanent interior installations in dry locations within distribution boards or small casings with DIN rail EN 60715-TH35-7,5.

**WARNING**

- The device must be mounted and commissioned by an authorised electrician.
- Free DIN rail areas with stuck-in data rails must be covered with covers, order no. 5WG1 192-8AA01.
- The prevailing safety rules must be heeded.
- The device must not be opened.
- For planning and construction of electric installations, the relevant guidelines, regulations and standards of the respective country are to be considered.

Technical Specifications**Network communication**

- Ethernet: 10BaseT (10 Mbit/s)
- Supported Internet Protocols: ARP, ICMP, IGMP, UDP/IP, DHCP, AutoIP
- KNXnet/IP according to KNX System Specification: Core, Routing, Tunneling, Device Management

Rated voltage

- Bus: DC 24V (DC 21...30V)
- Auxiliary power supply: from "Power over Ethernet" DC 48V (acc. to IEEE 802.3af) max. 0,8W
alternatively from external power supply AC/DC 24V (AC 12...24V, DC 12...30V) max. 1,7W (57mA @ DC 24V)

Power supply

- Bus voltage: via KNX/EIB bus line
- Operating voltage: from "Power over Ethernet" according to IEEE 802.3af, nominal voltage DC 48V
alternatively, from external SELV power supply AC/DC 24V nominal, permissible input voltage range: AC 12...24V, DC 12 ... 30 V
- Recommended power supplies:
 - DC 29V (before choke) from KNX/EIB power supply N125/21
 - door bell transformer 4AC3 108, AC 230V / AC 2x12V (primary / secondary), 2x0,33A, 2MU width

- door bell transformer 4AC3 116, AC 230V / AC 2x12V (primary / secondary), 2x0,67A, 2MU width
- door bell transformer 4AC3 140, AC 230V / AC 2x12V (primary / secondary), 2x1,67A, 3MU width

**CAUTION**

- It is recommended to use the external safety extra low voltage power supply for the IP Interface N148/22 only.

Power usage

- From the bus line: max. 10mA @ DC 29V
- From the auxiliary power supply: max. 1,7W (57mA @ DC 24V)

Control elements

1 learning button:
for switching between normal operating mode and addressing mode

Display elements

- 1 green LED: device ready (ON)
- 1 yellow LED: Communication on bus line
- 1 green LED: Ethernet Link Signal available (Lk)
- 1 yellow LED: Receiving data from Ethernet (Rx)
- 1 red LED: Transmitting data to Ethernet (Tx)
- 1 red LED: for monitoring bus voltage and displaying mode, selected with the learning button

Connections

- bus line: screwless bus connection block (red-black) 0,6...0,8 mm Ø single core
remove approx. 5mm of isolation
- Ethernet / IP network: RJ45 socket
- auxiliary power: screwless extra low voltage terminal (yellow-white) 0,6 ... 0,8 mm Ø single core
remove approx. 5mm of isolation

Physical specifications

- housing: plastic
- N-system DIN-rail mounted device, width: 2 SUs (1SU = 18mm)
- installation: rapid mounting on EN 60715-TH35-7,5 rail
- weight: approx. 105g
- Fire load: approx. 2840 kJ ± 10 %

Electrical safety

- degree of pollution (according to IEC 60664-1): 2
- protection (according to EN 60529): IP 20

- protection class (according to IEC 61140): III
- overvoltage class (according to IEC 60664-1): III
- bus: safety extra low voltage SELV DC 24 V
- the device complies with EN 50 090-2-2

Electromagnetic compatibility

complies with
EN 61000-6-2 and EN 61000-6-3 and EN 50090-2-2

Environmental specifications

- climatic conditions: EN 50090-2-2
- ambient temperature operating: - 5 ... + 45 °C
- storage temperature: - 25 ... + 70 °C
- relative humidity (non-condensing): 5 % to 93 %

Markings

EIB, KNX, CE

CE mark

complies with the EMC regulations (residential and functional buildings), and low voltage regulations

Location and Function of the Display and Operator Elements

Figure 1: Location of the display and operator elements

- A1 LED red: indicating normal operating mode (LED off) and addressing mode (LED on)
- A2 learning button for switching between normal operating mode and addressing mode for receiving the physical address
- A3 LED green: Operation
- A4 LED yellow: data transmission on bus line (Line)
- A5 LED green: Ethernet Link signal (Lk)
- A6 LED yellow: Ethernet Receive signal (Rx)
- A7 LED red: Ethernet Transmit signal (Tx)

Note

When the learning button (A2) is pressed, this LED signals for 10 seconds how the IP address was assigned to the device:

- 1x blinking: fixed IP address
- 2x blinking: DHCP
- 3x blinking: AutoIP

- A8 extra low-voltage bus terminals (red-black)
- A9 extra low-voltage terminals (yellow-white)
- A10 RJ45 socket for data network cable

Mounting and Wiring

General description

The N-system DIN-rail device can be installed in N-system distribution boards, surface or flush mounted, or on any DIN rail complying with EN 60715-TH35-7,5. The connection to the bus line is established via the bus connector terminal (red-black) on the top side. The RJ45 socket on the device front side provides the connection to the Ethernet-IP data network.

Mounting DIN-rail devices (Figure 5)

- Slide the device (B1) onto the DIN-rail (B2) and
- swivel back the device until the slide clicks into place audibly.

Dismounting DIN-rail devices (Figure 5)

- Remove all connected wires,
- press down the slide (C3) with a screw-driver and
- swivel the device (C1) from the DIN-rail (C2).

Figure 5: Mounting and dismounting a DIN-rail device

Slipping off bus connection blocks (Figure 6)

- The bus connection block (D2) is situated on the top of the device (D1).
- The bus connection block (D2) consists of two components (D2.1 and D2.2) with four terminal contacts each. Take care not to damage the two test sockets (D2.3) by accidentally connecting them to the bus cable or with the screw-driver (e.g. when attempting to unplug the bus connection block).
- Carefully put the screw-driver to the wire-inserting slit of the bus connection block's grey component and pull the bus connection block (D2) from the device (D1).

Slipping on bus connection blocks (Figure 6)

- Slip the bus connection block onto the guide slot and
- press the bus connection block (D2) down to the stop.

Connecting bus cables (Figure 6)

- The bus connection block (D2) can be used with single core conductors $\varnothing 0,6 \dots 0,8$ mm.
- Remove approx. 5 mm of insulation from the conductor (D2.4) and plug it into the bus connection block (D2) (red = +, black = -).

Disconnecting bus cables (Figure 6)

- Unplug the bus connection block (E1) and remove the bus cable conductor (E1.4) while simultaneously wiggling it.

Figure 6: Connecting and disconnecting bus wires

Slipping off / on auxiliary power connection block

- Follow the instructions for the bus connection block when slipping off/on the auxiliary power connection block.

Supported Software

Here is a list of software supporting the IP Interface N 148/22.

ComBridge Studio

IPAS GmbH
Grabenstr 149 a
47057 Duisburg
[<http://www.ipas-products.com>]

Visualization, Database interface,
Notification via email, OPC Server

ComBridge Studio is a visualization software that can use the IP Interface N148/22, the IP Router N146/02, the IP Controller N350E and the IP Viewer N151 as interface to KNX/EIB. Find more information in the GAMMA catalog or at the above listed web site.

ETS3

KNX Association
De Kleetlaan 5, Bus 11
B-1831 Brussels-Diegem
Belgium
[<http://www.knx.org>]

Configuration of bus installations via existing
data net works (ETS 3.0c or higher)

A KNXnet/IP driver is available for ETS3. When this driver is installed ETS3 may use the IP Interface N148/22, the IP Router N146/02, the IP Controller N350E and the IP Viewer N151 as interfaces to the bus just like a standard RS232 or USB serial interface. This function includes download of device configuration via the bus and the group monitor function of ETS3.

Note

The ETS3 driver currently does not support local download. When attempting a local download to the IP Interface N148/22 this message appears: "incompatible BCU version \$091A (required \$0012)".

Note

After installing the ETS3 driver and selecting the IP Interface N148/22 or the IP Router N146/02 as communication interface a windows message may pop up announcing that a "Class" is unknown. In this case install the Microsoft .Net Framework that you can download from the Microsoft software update site (file size: approx. 25MB).

General Notes

- The operating instructions must be handed over to the client.
- A faulty device shall be sent with a Return Good Note for Service provided by the appropriate Siemens sales office to the following address:
SIEMENS AG, Siemensstr. 10, D-93055 Regensburg
- If you have further questions concerning the product please contact our technical support:
 - ☎ +49 (0) 180 50 50-222
(0,14 €/min. from the German landline network, deviating mobile communications prices are possible)
 - ☎ +49 (0) 180 50 50-223
